KinTools provides a tool that allows the creation of a set of multiphonic sound spaces. KinTools is a flexible tool to create multiphonic sound spaces. It allows to independently control the sound source, the rewire source, and the loudspeakers placement. This great flexibility is supported by 6 different spatial configurations. The main features are:

- Create a space with a fixed spatial configuration.
- Create a multiphonic sound space with any number of channels.
- Create a multiphonic sound space with different rewire sources.
- Create a multiphonic sound space for the different rewire sources.
- Create a multiphonic sound space with a fixed rewire source.
- Create a sound space for both the rewire source and the loudspeakers.
- Decode the sequence events.
- The sound can be recorded in real time or saved as an Audio file.
- The sound can be played through external or internal sources: REASON, ORCHSCHER, ...
- Able to sync the sound to timecode and tempo information.
- Spectrogram analysis.
- Configuration tool that allows the sound to modulate a set of speakers.
- Configuration tool to modulate the rewire source

with a selectable sound. □ Spatial Events writing tool □ Screen display and configuration □ Equation editor to write an equation for the movement of the source. □ Audio filter to change the parameters of the space. □ Accurate positioning of the loudspeakers to get proper sound. □ Audacity tools to write the sequence of events. □ ReWire configurations: □ By Distance: The sound sources are distributed in the space according to a fixed distance within the limits. □ By Frequency: The sound sources are distributed by a signal envelope in the space. □ By Phase: The sound sources are distributed by a signal envelope in the space. □ By Color: The sound sources are distributed by a signal envelope in the space. □ By Delay: The sound sources are distributed by a signal envelope in the space. □ By Time: The sound sources are distributed by a signal envelope in the space. □ By Velocity

KinTools is a small audio tool written in Visual Basic (VB) and compiled in exe. It is optimized for professional use in large space shows. The modular structure is structured through the use of 4 modules. A great number of screens are loaded

using DirectX to display. The code is compatible with Windows 2000, XP or Vista. The Modules The modules function are inside the programs. The general view of the architecture shows:

- The "core" of the software: Two Windows Modules (WinFiles, Synth)
- The DirectX interface windows (WinScreen)
- Several other Windows Modules (ShowThread)
- Two Module game specific (ShowThread, WinScreen)

Now the modules are described with details:

- "core" module This module contains the sound engine and the file manager. It also contains the option module. It also contains classes and contains the functions on the tab "Graphics". Then the module is structured into the directory structure "core".
- "core" module function : From the programs.
- Sound : Load sound file and play. Parameter to control the sound speed (one of the 24 control set).
- File manager Control how the files are selected and played.
- Control module This module is where the user can select the components of the control of the sound speed. It also allows the user to save the selection.
- Synth: Play file and read MIDI file.
- Options module The user can change the parameters using this options window module.
- "core" module window module This module is created using Direct X. It

allows the user to see and edit all the windows of the module.

- DirectX DirectX is used to display all the windows of the module.
- ShowThread : This is a thread, created in the main program, to show all windows of the "core" module.
- ShowThread functions : Get the window parameters to display.

□ WINSCREEN This module is created using DirectX to see the windows of the module "core".

1. From the Recording Studio to the Soundstage

The sound of a television set can only occupy a small time space. When surrounded by several other sounds, it will generally appear soundless. With a music recording studio and some musical instruments, the producer can fill the studio by various sound sources to create a more complete ambience. When the music is played or a sound source is reproduced, the sounds are conveyed to the listener by different directions. Here, we also need to use our ears to read the sound filed and to generate sound by our hearing. If we wanted to use these sounds by a special program, we can't rely on these vibrations. If we want to accomplish this task, we will use high-tech tools to read the sounds, and then generate sound by these waveforms. The process of measurement and storage is called sound design.

2. Spatial Effect

The most difficult part of sound is that no matter how loud the sound, it's difficult to fill the large empty space in front of us. This is the problem of "spatial effect". In actual production, we can produce various sounds on different levels in the studio. We can find a lot of small sounds in a large

field. But it will never be the same as in the real reality.

3. Spatial Effect When you hear the sound from far away, Spatial effect. The three-dimensional reproduction process is a complex and difficult process. In the studio, a 5.1-st multi-channel surround setup and a state-of-the-art sound mixing system are generally required.

KinTools is based on a three-dimensional spatial audio engine, which can synthesize and simulate various sound effects. This engine provides a new way to create sound effects and spatialized audio, and it also allows sound designers to create spatial effects with a great effect. This engine is based on the Kinetic Amplifier technology, which can create many-channel sound effects. The source mode is also based on the Kinetic Amplifier technology. The application of the sound is possible in different ways. The developers can use the standalone app as a plug-in, to provide a variety of sound effects. In addition, the audio module can also be used in a large variety of applications, such as game development, virtual reality, and artificial intelligence, which makes the audio module more effective.
